

HELP ASTHMA RESEARCH REACH NEW HEIGHTS!

Stock photo. Posed by model.

The **ACADIA Study** aims to find out whether a rescue inhaler that doctors can currently prescribe for adults may also help **adolescents** control their asthma flare-ups.

If the descriptions below sound like a match for your child, we'd really like to hear from you!

- ▲ At least **12 but less than 18 years of age**
- ▲ Diagnosed with **asthma** at least 12 months ago
- ▲ Currently using an **inhaled steroid medication** (on its own or in combination with another asthma medication)
- ▲ Over the last 12 months had at least **1 but no more than 3 severe asthma episodes** that required **additional steroid medication**, an **emergency department visit**, or a **hospital stay**

There's a further checklist to find out who can join – the study team will discuss this with you/your child.

For adult caregivers wanting to find out more about the study, get in touch or visit our website.

Getting in touch does not mean your child must join the ACADIA Study or that your child will be able to take part. We will happily provide you/your child with the information you need to make an informed decision. Study rescue inhalers and study-related care will be provided at no cost.
