

ASTHMA CLINICAL STUDY

Is asthma holding you back?

Asthma symptoms can stand in the way of a great day or a good night's sleep.

See if you qualify for our RAINIER clinical study which is investigating a potential treatment that may help reduce asthma symptoms.

> rainierstudy.com

Asthma can cause shortness of breath, wheezing, chronic coughing, and chest tightness. Any of these symptoms can stand in the way of a great day or a good night's sleep.

Asthma sufferers are often sensitive to common allergens like dust or pollen, and it can be hard to know when symptoms can be triggered.

Other symptoms of asthma might include difficulty sleeping, feeling fatigued, difficulty exercising, anxiety, and more.

What is the RAINIER study?

The RAINIER clinical study is investigating a potential treatment that may help reduce some symptoms of asthma.

For adults with Asthma

This study is investigating the medication solrikitug for its safety and effective treatment of asthma in adults. This drug works by blocking a chain reaction in the immune system that contributes to inflammation, which can lead to a flare-up.

Interested in learning more?

Talk to your physician to see if the Rainier study might be a good resource for you. Then call/email/visit PRC (upstairs in Suite 200) and we can tell you more about the study and let you know if you are eligible to join.
